

Payment Gateway Product Guide

Synthetic enterprise knowledge-base content for the Enterprise Knowledge & Support Copilot.

Overview

Payment Gateway handles payment creation, authorization, capture, failure, reversal, and reconciliation. Supported methods include cards, UPI, net banking, and selected wallets.

Each transaction receives a `payment_id` and moves through states such as `CREATED`, `PENDING`, `AUTHORIZED`, `CAPTURED`, `FAILED`, and `REFUNDED`.

Payment lifecycle

Checkout creates a payment request, the gateway validates it, the payment provider performs authorization, and the gateway records the provider result.

Order fulfillment must use the authoritative server-side payment state. A client-side success screen is not sufficient evidence of a successful payment.

Common failure reasons

Card payments can fail because of insufficient funds, issuer decline, expired cards, authentication failure, fraud controls, or provider downtime.

UPI payments can remain pending when authorization succeeds but provider confirmation or callback processing is delayed.

Operational guidance

Use `payment_id` during investigation. Check provider response code, gateway status, callback status, and reconciliation status before retrying.

Always check for a successful duplicate transaction before initiating a new charge.
